Categories

Overview

The **Categories** section allows administrators to organize pages into a structured hierarchy. Categories make it easier to manage, navigate, and display related pages within the application.

> **Note:**
> A default **Root** category is available in the system and acts as the top-level parent for all categories.

Create a New Category

To create a new category:

1. Navigate to **Pages → Categories**.
2. Click **Add New Category**.
3. Fill in the required details.
4. Click **Create** to add the category.

Category Fields

Field	Description
Title	Enter the name of the category. Maximum **255 characters**.
Parent Category	Select the parent category under which the new category will be created. By default, **Root (/)** is available.
Description	Enter a brief description of the category (Optional).

Category List

After a category is created, it is displayed in the **Categories** table.

The table contains the following information:

Column	Description
Parent Category	Displays the parent category of the current category.
Title	Displays the category name.
Status	Indicates whether the category is **Visible** or hidden.
Modified At	Displays the date and time when the category was last updated.

Additional features available on this page include:

- **Search** to quickly find a category.
- **Entries** to control the number of records displayed per page.

Default Root Category

The application includes a default **Root** category.

- The **Root** category serves as the top-level category.
- New categories can be created directly under **Root** or under any existing parent category.
- Organizing categories under appropriate parent categories helps maintain a clear and structured hierarchy.

> **Best Practice:**
> Use meaningful and descriptive category names to keep the page structure organized and easy to manage.

Products

Overview

The **Products** section allows administrators to create and manage products that are displayed within the application. Each product can be assigned to one or more categories, making it easier to organize and present content.

Create a New Product

To create a new product:

1. Navigate to **Pages → Products**.
2. Click **Add New Product**.
3. Fill in the required product details.
4. Click **Create** to save the product.

Product Fields

Field	Description
Title	Enter the product name. Maximum **255 characters**.
Select Categories	Select one or more categories to which the product belongs.
Description	Enter a brief description of the product (Optional).

> **Note:**
> Products can only be assigned to categories that have already been created in the **Categories** section.

Product List

After a product is created, it appears in the **Products** table.

The table includes the following information:

Column	Description
Title	Displays the product name.
Status	Indicates whether the product is **Visible** or hidden.
Modified At	Displays the date and time of the last modification.
Action	Provides options to manage the selected product.

Additional features available on this page include:

- **Search** to quickly locate a product.
- **Entries** to control the number of products displayed per page.

Best Practice

- Create the required **Categories** before adding products.
- Use clear and descriptive product titles for easier management.
- Assign products to the appropriate categories to maintain a well-organized content structure.

Languages

Overview

The **Language** section allows administrators to manage and customize the text displayed throughout the application. It provides a centralized location for translating system labels, buttons, messages, and other interface elements into different languages.

Base Language

The **Base Language** is the default language used by the application. It contains all predefined system text that can be translated into the desired language.

Language Details

Field	Description
Title	Enter the name of the language. Maximum **64 characters** .
System Translation	Displays all default system labels and messages available for translation.

System Translation

The **System Translation** section contains all default application text used throughout the system.

Examples include:

- Account
- Home
- Categories
- Products
- Cart
- Search

- Maps
- Forms
- Resources
- Images
- Videos
- Submit
- Cancel
- Confirm
- Update
- Delete
- Loading...
- Error Messages
- Validation Messages
- Order Messages
- Printer Messages
- Navigation Labels
- Notifications
- System Alerts

For each system label:

- The **left side** displays the original system text.
- The **right side** allows administrators to enter the translated text for the selected language.

> **Note:**
> Only the translated value should be modified. The original system keys remain unchanged.

Custom Translation

The **Custom Translation** section allows administrators to create translations for custom labels that are not included in the default system translations.

Field	Description
Key	Enter the unique identifier for the custom text.
Translated Text	Enter the translated value that will be displayed in the application.

Use **Custom Translation** when additional application text needs to be localized without modifying the default system translations.

How to Configure a Language

1. Navigate to **Pages → Language**.
2. Enter the **Language Title**.
3. Translate the required values under **System Translation**.
4. Add any additional translations under **Custom Translation**, if required.
5. Click **Submit** to save the language configuration.

Best Practices

- Translate only the values on the right side of the translation fields.
- Keep translations clear, consistent, and user-friendly.
- Use **Custom Translation** only for application-specific text that is not available in the default system translation.
- Review all translated content before publishing to ensure accuracy.

> **Important:**
> Any changes made to **System Translation** or **Custom Translation** will not be applied until you click the **Update** button.
