Scheduler (Inactive Scheduler)

Overview

The **Inactive Schedulers** section displays all schedulers that are currently disabled or inactive. These schedulers are not executed by the system until they are enabled again.

This page helps administrators identify scheduled tasks that are temporarily unavailable or intentionally disabled.

Inactive Schedulers

Navigate to **Modules → Inactive Schedulers** to view all inactive scheduler configurations.

Only schedulers with an **Inactive** status are displayed in this section.

Inactive Scheduler Details

The list provides information about inactive schedulers, allowing administrators to review their current status and configuration.

Typical information includes:

- Scheduler Name
- Status
- Scheduled Task
- Last Modified Date
- Available Actions

Manage Inactive Schedulers

Administrators can:

- View all inactive schedulers.
- Review scheduler configurations.
- Identify disabled scheduled tasks.
- Enable schedulers when required.
- Monitor inactive scheduler records for maintenance purposes.

Best Practices

- Periodically review inactive schedulers.
- Enable only the schedulers that are required.
- Remove or update obsolete scheduler configurations.
- Verify scheduler settings before reactivating them.

> **Important:**
> Schedulers listed in the **Inactive Schedulers** section will **not execute** until they are enabled. Only active schedulers are processed by the system according to their configured schedule.
