Scheduler (Scheduler Logs)

Overview

The **Scheduler Log** section records the execution history of all scheduled tasks configured within the application. Whenever a scheduler runs, the system automatically generates a log entry, allowing administrators to monitor and verify scheduled activities.

This helps in tracking successful executions and troubleshooting scheduled operations when required.

Scheduler Logs

Navigate to **Modules → Scheduler Log** to view all scheduler activity.

The page displays a chronological list of executed scheduler events.

Scheduler Log Details

Each log entry contains the following information:

Column	Description
ID	Unique identifier of the scheduler log.
Log Time	Date and time when the scheduler was executed.
Type	Displays the type of scheduled task performed.
Item	Shows the item or module associated with the scheduler.
Action	Displays the action performed during execution.
Log ID	Unique reference ID generated for the scheduler event.

Search Scheduler Logs

Use the **Search** field to quickly find a specific scheduler log based on the available information.

The **Show Entries** option allows administrators to control the number of log records displayed on a single page.

Manage Scheduler Logs

Administrators can:

- View the execution history of scheduled tasks.
- Monitor scheduler activity.
- Verify whether scheduled jobs have executed successfully.
- Search for specific log entries for troubleshooting.

Best Practices

- Review Scheduler Logs regularly to verify scheduled tasks.
- Monitor logs after creating or modifying a scheduler.
- Use the Search option to quickly locate specific log entries.
- Investigate missing or failed scheduler executions when expected logs are not generated.

> **Important:**
> Every time a scheduler is executed, the system automatically creates a corresponding log entry in the **Scheduler Log** section. If no scheduler has been executed, the page will display **"No data available in table."**
